

ScrubServe™ - Dispenser

from LEF Systems

Automated Scrub Management

ScrubServe is a cost-effective patented solution for scrub management

ScrubServe Dispenser

The ScrubServe scrub management system is based on a Dispenser and Receiver combination.

With the ScrubServe dispenser only authorised users with an ID-card can obtain access to clean scrubs, and staff must return scrubs they have before they can access further clean items. Our dispenser can securely dispense theatre scrubs, smaller uniform items, uniform accessories, aprons, mops, towels, and disposable items such as lab-coats.

The associated Receiver unit provides credit for returned scrubs, and records a digital image of all returned items which minimises inventory abuse.

By ensuring scrubs are only issued to authorized staff, and that they are securely returned after use, your inventory replacement costs and associated laundry costs can be controlled and minimised.

Savings through the use of an automated scrub management system are typically 90% on scrub losses and 40% on scrub laundry costs.

Staff will no longer be able to hoard scrubs in their locker, unauthorized staff will no longer have access, and staff that require clean scrubs can be confident of obtaining the size they require, when they need it.

ScrubServe is designed for ease of use. The system is easily managed using our ScrubServe Management Software which is provided free of charge. Our management software is a PC application which can be used to manage your entire system, staff requirements, inventory and reports. ScrubServe can be scaled to your specific site requirements.

ScrubServe helps to eliminate possible cross-infection by specifically separating scrub dispensing from scrub receiving. Our system does not combine clean dispensing alongside the soiled return receiver within the same cabinet. Our separate units are designed to provide a small, compact, corridor friendly format that can be unobtrusively placed within your facility.

ScrubServe Operation

ScrubServe is a modular system. Dependant on the dispensing capacity you require, any number of dispenser units can be installed to cater for your staff requirements.

Each dispenser unit consists of 8 locked drawers, which are secure and cannot be opened. Within each drawer there are 11 separately locked compartments. Each dispenser unit stores up to 88 scrub sets, or 88 individual scrub items.

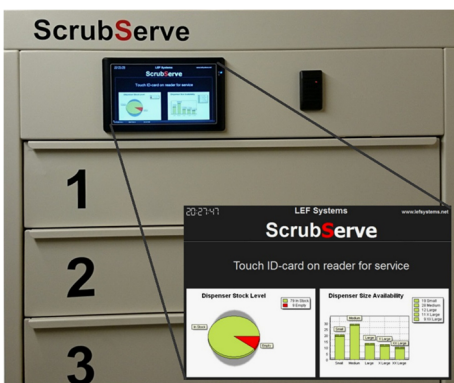

Each of the 88 compartments can be programmed to contain any particular size combination. It would be typical to divide up the number of compartments between the size combinations that are required to be issued.

In the idle situation, whilst waiting for a staff member, the dispenser touch-screen displays "Touch ID-card on reader for service".

When an authorised user utilizes their ID-card, their card number will be automatically recognized and the staff member will be prompted to open a nominated drawer. For example, "Open Drawer 3" will be displayed. At that moment only drawer 3 will be unlocked and the staff member can only open that drawer.

Upon opening the nominated drawer only one compartment will be accessible, the compartment containing their requested size item, as shown opposite.

ScrubServe delivers fast - from the moment a staff member uses their ID-card, a drawer will be opened within 2-seconds. Once the staff member has removed their uniform item from the compartment the unit is immediately available for the next user.

Stock levels can be immediately seen from touch-screen

When a drawer is unlocked the staff member is only able to access one compartment from the 11 available. E.g. compartment 4 as shown above
